

SEX in the city

how feminism improves our all urban life

We don't want to talk about sex but about gender.

European cities are a historical palimpsest of centuries, therefore a manifestation of a patriarchal society.

The achievements of the female and minority empowerment will guide us to smart design principles and an urbanity better suited for the marginalised majority and other marginalised groups in this highly pluralistic society.

SEX in the bushes

how to become a reproductive ecosystem

Sex is life!
It's part of reproduction for many living beings including us humans. A reproductive ecosystem is essential for our last existence.
As we understand the impact of our doing on planet earth in the realm of the anthropocene we have to create sex friendly world in a post binary understanding of nature and culture.
We are nature and we have to reproduce.

a post binary nature culture urbanism

In a post-binary nature culture urbanism, city and nature blend harmoniously. Urban ecosystems are vital in the Anthropocene, mitigating climate change and preserving biodiversity. Green spaces, parks, and water bodies provide crucial ecological services, fostering biodiversity and habitat connectivity amid urbanization. Protecting urban ecosystems is essential for sustainable and resilient cities coexisting within and as part of nature.

Reproductive Productive ecosystems

Sustainable small-scale agriculture, or reproductive agricultural production, enhances soil fertility, biodiversity, and ecosystem health. Through local crops, organic methods, and responsible water use, it minimizes ecological impact, empowering communities and promoting food sovereignty. This approach fosters resilience against climate change, ensuring food security and safeguarding natural resources for the future.

the value of nature ecosystem services

In the anthropocene, urban ecosystems play a crucial role in enhancing human well-being. Green spaces promote physical and mental health, while fostering a sense of community and connecting people with nature and each other. Emphasizing and preserving urban ecosystems is essential for promoting green and ecologic urbanism, ensuring cities are sustainable and improve the overall quality of life for their inhabitants.

SEX in the future

how to live and to live on in the time of the anthropocene

To live on and to live on well future urban developments have to:
1. reduce our environmental impact and therefore slow down and ideally stop climate change.
2. we have to face climate change an dress accordingly, with a climate adapted urbanism.

Re- ... Existing Buildings

To develop Wolfsanger/Hasenhecke's local identity amid climate change, utilizing existing city buildings is crucial. Retrofitting reduces emissions and preserves cultural heritage, fostering community identity. Prioritizing existing structures curbs urban sprawl, promoting sustainable development, and minimizing environmental impact.

The building structure will enhance urban and natural axis that are essential as wind corridors that bring fresh air into the city. Furthermore, the green axis regulate the micro climate, help water management, reduce urban heat island.

gender-equitable mobility

Since men and women* have different mobility patterns and divers needs, a well-connected, safe and accessible public transportation system reduces the gendered burden of transportation responsibilities for some individuals.
